Description

Plunger Pumps are designed for a wide variety of high pressure washing applications. They are constructed with die-cast bodies and feature a brass head. Internal components include coated ceramic plungers for long life and durability. Precision cast cooling fins are anodized for maximum heat dissipation. Oversized needle bearings on the drive side, and ball on the non-drive side together with the precision supports assure positive alignment and centering in relation to the crankcase. Valve cages of special designed Ultra-Form provide positive seating and extended life. One-piece connecting rods are special alloy aluminum, bronze rods over 4,000 psi units, oversized for strength and load disbursement. These pumps are designed for gasoline driven systems.

RSV - D version + F25
Hollow shaft pump  Ø 3/4”

RSV - D version + F40
Hollow shaft pump  Ø 1”
Formulas

**Nozzles:**
- Impact Force (lbs.) = \((0.0526 \times \text{GPM} \times \sqrt{\text{PSI}})\)
- Nozzle # = \(\frac{\text{GPM} \times 4000}{\sqrt{\text{PSI}}}\)
- \(\text{GPM} = \frac{\text{Nozzle} \times \sqrt{4000}}{\text{PSI}}\)
- \(\text{PSI} = \left(\frac{\text{GPM}}{\text{Nozzle} \#}\right)^2 \times 4000\)

**Horse Power:**
- \(\text{GPM} \times \text{PSI} = \text{Hydraulic HP} \times 1714\)
- \(\text{GPM} \times \text{PSI} = \text{EBHP} \times 1457\)
- \(\text{EBHP} \times 1457 = \text{GPM} \times \text{PSI}\)
- \(\text{EBHP} \times 1457 = \frac{\text{PSI}}{\text{GPM}}\)

HP loss due to altitude = 3% per 1000 FT above sea level

**Pump Speed and Flow:**
- Rated GPM = Desired GPM
- Rated RPM = Desired RPM
- Motor Pulley Ø = Pump Pulley Ø
- Pump RPM = Motor RPM

Conversions

- Gallons x 3.785412 = Liters
- Gallons x 128 = Oz.
- PSI x 0.06896 = Bar
- Bar x 14.5038 = PSI
- 1 inches = 25.4 millimeters
- Liters x 0.2642 = Gallons (US)
- Ft. Lbs. x 1.356 = Newton Meters
- Inch Lbs. x 0.11298 = Newton Meters
- Newton Meters x 8.85 = In. Lbs. (force)
- Temperature = \(1.8(C° + 17.78) = F°, .555(F° - 32) = C°\)
- 1 U.S. Gallon of freshwater = 8.33 lbs.
- 1 PSI = 2.31 feet of water
- 1 PSI = 2.04 inches of mercury
- 1 Foot of water = .433 PSI
- 1 Foot of water = .885 inches of mercury
- 1 Meter of water = 3.28 feet of water
- Kilograms x 2.2 = Lbs.

General Safety Information

**WARNINGS**

Gasoline Drive Pumps
- The pump is designed to pump non-flammable or non-explosive fluids. These pumps are intended to pump clean filtered water only.
- Do not operate in or around an explosive environment.
- Always wear safety glasses or goggles and appropriate clothing.
- Do not alter the pump from the manufacturers design.
- Do not allow children to operate the pump.
- Never point the high-pressure discharge at a person, any part of the body or animals.
- Do not operate gasoline engines in a confined area; always have adequate ventilation.
- Do not exceed the pump specifications in speed or pressure.
Plunger Pumps

General Safety Information (continued)

Maximum water temperature is 140°F.

All positive displacement plunger pumps must have a safety relief valve installed on the discharge side of the pump, this valve could be either an unloader or regulator and must be of adequate flow and pressure for the pump.

Adequate protective guards must cover all moving parts. Perform routine maintenance on the pump and components.

Use only components that are rated for the flow and pressure of the pump, this would include hose, fittings, safety valves, spray guns etc.

Electric Drive Pumps

Your power supply must conform to the system requirements.

The motor must be grounded. Use GFCI plugs and receivers.

Do not handle the pump/motor with wet hands.

Only use power cords that are in good condition.

Never pull the unit by the power cord.

Never spray or clean the unit with water

Failure to follow these warnings may result in personal injury or damage to property.

Installation

Direct Drive Gasoline Pumps

1. Install the shaft key into the keyway and apply a light coating of anti-seize on the engine shaft. (See Figure 3)

2. Align the two key ways and push the pump completely onto the engine.

3. Install all four (4) bolts and tighten evenly.

4. Remove the red shipping oil cap and install the black crankcase vent cap. (See Figure 4)

5. Install the appropriate unloader valve and other accessories.

6. Install the appropriate water inlet and discharge fittings.

7. Connect the water supply hose and high-pressure discharge hose/spray gun.

8. Turn on the water supply.

9. Open the spray gun to purge the system of any air.

10. Start the engine.

11. Adjust the engine speed and unloader valve.

Winter or Long Time Storage

1. Drain all of the water out of the pump.

2. Run a 50% solution of a RV or non-toxic/biodegradable antifreeze
Plunger Pumps

Installation (continued)

3. Flush the pump with fresh water before the next use.

4. In freezing conditions failure to do this may cause internal pump damage.

5. For long periods of storage in non-freezing areas the solution will keep the seals and O-rings lubricated.

Service Pumps

Servicing the Valves

The inlet and discharge valves in this series pumps are all the same. The valves are located under the six 19mm hex plugs. The inlet valves are located on the inside portion of the head under the seal assemblies and the discharge valves are located on the top row of the pump head.

Tools required: #8-32x” machine screw and diagonal pliers, screw driver, 19mm socket, ratchet, and torque wrench.

Discharge Valve

Removal:

1. Remove the valve cap. (See Figure 5)

2. Inspect the valve cap O-ring for any damage, replace if necessary.

3. Screw the machine screw into the hole on top of the valve cage (approx 1/8”). Using the diagonal pliers grasp the screw at the lowest reachable point. Using the pump head as a base, push down on the pliers, the valve will lift out. (See Figure 6)

4. Use a small probe to move the poppet up and down to assure that the valve is functioning properly and that no debris is stuck in the valve. (See Figure 7)

5. Inspect the valve o-ring for any damage, replace if necessary.

Discharge Valve Assembly:

1. Insert the valve assembly squarely into the port pushing it into place with a deep well socket (you will feel the valve assembly seat). (See Figure 8)

3. Install the valve cap and torque to the proper specification. (See Figure 9)

Servicing the Packings/Seals and Inlet Valves

To access the water seals and inlet valves for inspection or replacement, you will first need to remove the head of the pump.

Tools required: 5mm hex socket, ratchet, (2) long screwdrivers, channel lock pliers, mechanics pick and torque wrench.
Service Pumps (continued)

Disassembly:

1. First remove the eight 5mm head bolts. (See Figure 10)

2. Place the screwdrivers as shown between the head and crankcase of the pump, lifting one up and the other down. The head should start to lift off of the plungers. (See Figure 11)

3. When you remove the head you may notice that some of the water seals have stayed on the plungers and some in the head. To remove the seals from the plungers simple turn the assemblies and pull off. (See Figure 12)

4. If the seal assemblies are in the head use the channel lock pliers to grab the seal retainer on the outside ring, twist the retainer in either direction (this is done to free the retainer O-ring which is stuck to the manifold) and lift out. (See Figure 13)

5. With your finger pull out the white restop ring. (See Figure 14)

6. With your finger pull the high-pressure seal and head ring out of the head. (See Figure 15)

7. The low-pressure seal is located in the brass seal retainer. Using the mechanics pick, go in between the seal and retainer and pull the seal toward the center and pull outwards. (See Figure 16)

8. Remove the seal retainer O-ring with the mechanics pick. (See Figure 17)

Assembly:

1. Install the plastic head ring into the head (the flat side is on the bottom). (See Figure 18)

2. Install the high-pressure seal. Place the seal so the open “V” portion is toward the head ring. You need to place the seal at an angle and pull and push to work the seal into position with your fingers (do not use any tools you may damage the seal). Make sure the seal is totally seated against the head ring. (See Figure 19 & 20)

3. Place the white restop ring so it mates to the top of the high pressure...
Plunger Pumps

Service Pumps (continued)

head as a base, push down on the
pliers, the valve will lift out.

4. Use a small probe to move the
poppet up and down to assure that
the valve is functioning properly
and that no debris is stuck in the
valve.

5. Inspect the valve o-ring for any
damage, replace if necessary.

Inlet Valve Assembly:

1. Insert the valve assembly squarely
into the port pushing it into place
with a deep well socket (you will
feel the valve assembly seat).

3. Install the valve cap and torque to
the proper specification.

Pump Head to Drive End

Installation

1. Turn the crankshaft to align
the plungers as shown. (See
Figure 25)

2. Place the head
evenly onto the
plungers and push
it until it makes
contact with the
drive end of the
pump. (See Figure 26)

3. Torque the head
bolt as shown in the
tightening sequence
diagram. (See Figure
27 & 28)

Inlet Valve Removal:

1. Remove the valve cap.

2. Inspect the valve cap O-ring for any
damage, replace if necessary.

3. Screw the machine screw into
the hole on top of the valve cage
(approx 1/8”). Using the diagonal
pliers grasp the screw at the lowest
reachable point. Using the pump

5. Install the retainer
O-ring. (See Figure 23)

6. Squarely seat the
retainer into the head
and push with even
pressure until it snaps
into position. (See
Figure 24)

Place the seal into
the gland at an
angle, with your
finger push the
exposed side of the
seal towards the center
and work the seal into position.
After the seal is in the gland you
can work it into it proper position.
(See Figure 22)

Figure 21

Figure 23

Figure 24

Figure 25

Figure 26

Figure 27

Figure 28
Plunger Pumps

Service Pumps (continued)

Oil Change
Change oil after first 50 hours of use. Then every 500 hours. Refer to parts breakdown for oil type.

Servicing the Built-in Unloader and Check Valve
These parts are serviced as assembled kits.

Tools required: 3/8” drive ratchet, 19mm deepwell socket, medium strength thread locker, needle nose pliers.

Check Valve Removal:
1. Remove the chemical injector discharge nipple. Use the needle nose pliers to lift out the check valve. (See Figure 29)

Check Valve Assembly:
1. Place the check valve into the discharge outlet with the pointed side going in first (NOTE: older model pumps have springs that go into the hollow portion of the valve, newer models do not have springs.) (See Figure 30)
2. Inspect the o-rings on the injection nipple, if damaged replace. Place small amount of thread locker on the thread and tighten. (See Figure 31)

Unloader Removal:
Tools required: 3/8” ratchet, 22mm deep well socket, crescent wrench, small hammer, 6mm x approximately 8mm or longer, medium strength thread locker.

Unloader assembly removal:
1. Using the 22mm socket rotate the pressure adjusting cap so both set of hexes are aligned. Use screw to remove the complete unloader assembly. (See Figure 32)

1. Screw the 6mm bolt into the unloader piston seat, grab the bolt with the crescent wrench just under the head. Using the hammer tap the bottom of the wrench. The seat will pop out. (See Figure 33)

Unloader assembly:
1. Piston seat installation screw the new seat onto the bolt (NOTE: the flat side is the bottom). Push squarely into the unloader base and tap into place with the hammer. (Remove the bolt) (See Figures 34 & 35)
2. Place a small amount of thread locker on the unloader cartridge threads and screw into the base and tighten.
Unloader Adjusting Instructions

Follow these easy steps to adjust the pressure:

1. Loosen nut (pos. #3) with 10mm wrench.
2. Turn brass (pos. #4) clockwise until it stops.
3. Start pump, watch pressure gauge and turn (pos. #2) using 3mm hex clockwise until recommended/rated pressure is obtained. Line pressure will be approximately 200 psi less then actual head pressure. DO NOT set line pressure to rated.
4. Release trigger and make sure there is minimal spike (200-300 psi) (Repeat this step two or three times).
5. Tighten nut (pos. #3) down against (pos. #4).

**LIMITED WARRANTY**

Annovi Reverberi (A.R.) *Cam Shaft Plunger Pumps* are warranted for a period of five years and *Axial Radial Pumps* are warranted for a period of one year to the original purchaser. *Electric Pressure Washers* are warranted for a period of one year to the original purchaser. This is from the date shipped from factory or U.S. Warehouse. **AR, ArrowLine** and **GF** accessories are warranted for a period of 90 days.

Warranty covers manufacturing defects or workmanship that may develop under normal use and service in a manner up to the directions and usage recommended by the manufacturer.

Warranty does not apply to misuse or when pump or accessory is altered or used in excess of recommended speeds, pressures, temperatures or handling fluids not suitable for pump or accessory material construction. Warranty does not apply to normal wear, freight damage, freezing damage or damage caused by parts or accessories not supplied by AR North America, Inc.

Liability of manufacturer for warranty is limited to repair or replacement at the option of the manufacturer when such products are found to be of original defect or workmanship at the time it was shipped from factory. This warranty is in lieu of all other warranties, expressed or implied, including any warranty of merchantability and of any and all other obligations or liabilities on the part of the manufacturers or equipment.

**WARRANTY RETURNS**

Items returned for warranty consideration must have a **Returned Merchandise Authorization (RMA)** number. All unauthorized returns will be refused and shipped back to sender. Please fax requests to: 763-398-2009 or e-mail to shop@arnorthamerica.com.
